

Cisco Software Manager (CSM) Migrate to IOS XR 64 bit on ASR9K

ASR9K IOS XR 64 Bit (ASR9K-64) Migration User Guide

This document will help you in getting started with your migration from ASR9K standard 32 bit image to the new 64 bit image. Prior to scheduling migration, you can use these two modules to verify and prepare for migration:

- Configuration Conversion – Visualization of configuration conversion/migration
- Migration-Audit – Hardware audit for migration

Actual migration takes three major steps:

- Pre-Migrate – System preparation
- Migrate – Installation of new 64-bit OS
- Post-Migrate – Post-installation actions

Notes on Device Configurations

Important: The ASR 9000 operational configuration is not completely compatible with ASR9K-64, therefore it must be converted/migrated* for use in the 64-bit version. A copy of the 32-bit configuration is backed up for reference.

You have the following two options:

Option 1: Migration of On-box Configurations

- CSM will migrate the “on-box” ASR9K configurations (admin & IOS-XR) only

Option 2: Loading Custom Configurations

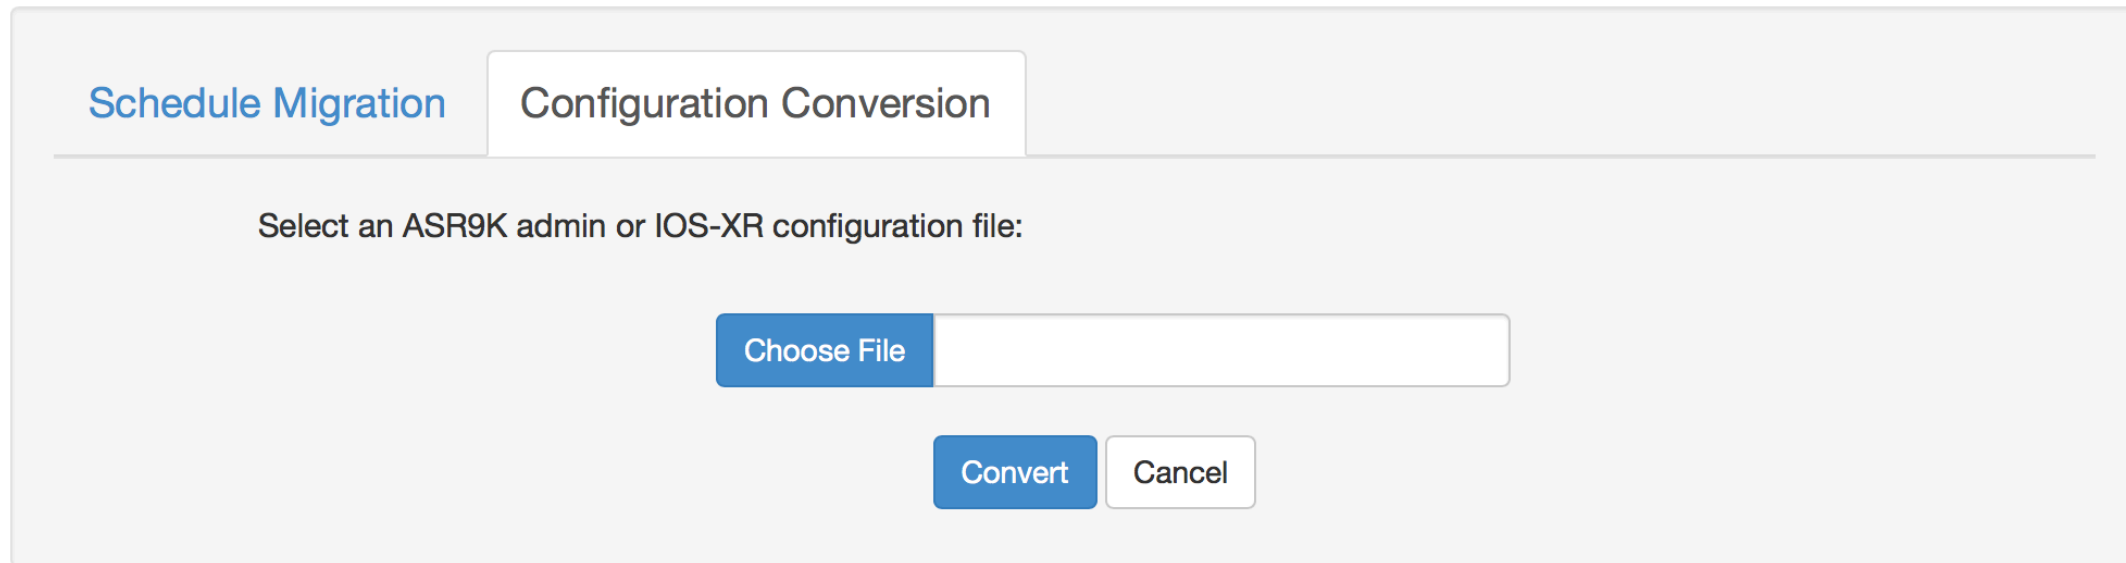

- CSM will migrate the “on-box” ASR9K admin configuration
- In addition, CSM will load any valid ASR9K-64 user-specified IOS-XR configuration

* Configuration migration is accomplished using the NoX tool. For more information, please visit this site:

http://xrgeeks.cisco.com/sox/Nox_Tool.html

Configuration Conversion

- In the Configuration Conversion module, CSM allows users to see how NoX processes each line of ASR9K configuration.
- **How to access:** [Tools > ASR9K to ASR9K-64 Migration](#), click on [Configuration Conversion](#) tab.
- Choose a ASR9K configuration file on the file system and click Convert.

The screenshot shows a web interface for the Configuration Conversion module. At the top, there are two tabs: 'Schedule Migration' and 'Configuration Conversion'. The 'Configuration Conversion' tab is active. Below the tabs, the text 'Select an ASR9K admin or IOS-XR configuration file:' is displayed. Underneath this text is a file selection area consisting of a blue button labeled 'Choose File' followed by a white text input field. Below the input field are two buttons: a blue 'Convert' button and a white 'Cancel' button.

Configuration Conversion (Cont.)

- The conversion process will first make sure that the latest NoX conversion tool from CCO is downloaded.
- Depending on the size of the configuration file, it may take up to minutes to finish conversion and loading.
- The status of the conversion is displayed under the convert button. Some possible statuses:
 - Preparing the conversion
 - Converting the configurations
 - Conversion completed. Loading the files.

[Schedule Migration](#) Configuration Conversion

Select an ASR9K admin or IOS-XR configuration file:

Choose File

PE1-configs

Convert

Cancel

Preparing the conversion

Configuration Conversion (Cont.)

In the end, you will see this pop-up.

- The textbox on the left contains your input configuration file, with each line color coded according to the conversion report from NoX.
- The color code/category is explained in the tooltip when you hover over it.
- You can choose to filter certain categories to hide and show lines that belong to certain category. Note that if the configuration file is large, it will take several seconds to update the display.
- The textbox on the right displays the converted ASR9K-64 configurations.
- The part on the bottom allows user to upload converted configuration file(s) to a selected server repository. Click the blue instruction icon to see why there could be one or two converted files.
- The input file and converted files can be f

Migration Pre-requisites

- In order to migrate to ASR9K-64 images, the release version on device MUST be at release 5.3.3 or greater.
- Supported hardware for RP, RSP, FC, FAN, PEM and MPA. The full list is on next page.
 - The unsupported line cards may not boot up after migration.
 - User also has a chance to skip the hardware audit for FAN and PEM with the acknowledgement that the unsupported FAN and PEM will fail to boot.
- All supported hardware are in their appropriate final states:
 - RSP, RP and LC: IOS XR RUN
 - FC: OK
 - FAN and PEM: READY
 - MPA: OK
- User must provide console connection for all devices on CSM.
- Must be able to ping the selected server repository (FTP, SFTP or TFTP) from the device.
- FPD package must be already installed on device.
- User must select the unified FPD SMU for Pre-Migrate if the release version on device is below 6.1.1.

Supported hardware: (*Note: Card types in red are only supported in 6.2.1 onwards, everything else is supported in 6.1.1 onwards.)

CSM Migration to ASR9K-64

- CSM allows for the migration from IOS-XR (classic) to IOS-XR 64 bit for ASR9K devices.
- **How to access:** [Tools > ASR9K to ASR9K-64 Migration](#).
- **Verification action:** [Migration-Audit](#)
[Migration-Audit](#) checks if the hardware on device(s) is supported in ASR9K-64 and is in operational state.
- **Migration actions:** [Pre-Migrate](#), [Migrate](#) and [Post-Migrate](#).
[Pre-Migrate](#) prepares the device(s) for migration. It also executes Migration-Audit as a part of the pre-requisite check.
[Migrate](#) updates settings and reloads the device(s) to boot ASR9K-64 image.
[Post-Migrate](#) loads migrated Calvados/admin configurations and upgrades FPD's upon successful booting. (More details later)

The screenshot displays the 'Configuration Conversion' tab in the CSM interface. On the left, there are three input fields: 'Install Action', 'Scheduled Time', and 'Custom Command Profile'. On the right, a dropdown menu titled 'Select Desirable Action(s)' is open, showing a list of actions. The 'Migration-Audit' action is highlighted in blue. Below the 'Migration' section, the actions 'Pre-Migrate', 'Migrate', 'Post-Migrate', and 'ALL' are listed.

Install Action	Scheduled Time	Custom Command Profile	Select Desirable Action(s)
			Verification
			Migration-Audit
			Migration
			Pre-Migrate
			Migrate
			Post-Migrate
			ALL

Scheduling Action

- Dependencies of the actions:
 - The verification action Migration-Audit can only be selected by itself. The three migration actions has no dependency on it.
 - In order to complete migration, all three migration actions must have successfully executed.
 - Migration actions can be scheduled all at once or one at a time, but they must occur in the order shown below.
 - For example, Migrate cannot be scheduled unless Pre-Migrate is scheduled to run, or is in progress, or has already completed successfully.
 - Failures in pre-requisite actions can suspend the execution of any remaining options.
 - Deleting the pre-requisite will also delete all actions that are dependent on it.
- Choose desirable scheduled time.

The screenshot shows a 'Schedule Migration' dialog box with two tabs: 'Schedule Migration' (active) and 'Configuration Conversion'. The dialog contains the following fields and controls:

- Install Action:** A dropdown menu with three options: '× Pre-Migrate', '× Migrate', and '× Post-Migrate'. The '× Pre-Migrate' option is currently selected.
- Scheduled Time:** A text field displaying '07/27/2016 03:37 PM' with a calendar icon to its right.
- Custom Command Profile:** A text field with the value 'Optional'.
- Buttons:** 'Continue' and 'Cancel' buttons at the bottom right.

Scheduling Action (Cont.)

- (Optional) Use the Custom Command Profile if you wish to capture any CLI command output. These custom commands will be executed **before** each selected migration action executes.
- Note: By default, the following CLI commands already run in their appropriate stages and do not need to be duplicated in the Custom Command Profile: admin show running-config, show running-config, show platform.
- Click Continue to trigger the Migration Wizard.

Scheduling a Migration (Cont.)

- If you selected “Pre-Migrate”, you will be prompted to specify a FTP, SFTP or TFTP server repository and the directory. At this stage, only the following two packages can be selected:
 1. The ASR9K-64 tar file containing the ISO image and boot files. The filename must match wildcard expression **asr9k*.tar*** and must include the 3 digit ASR9K-64 version. Example: asr9k-mini-x64-migrate_to_eXR.tar-6.1.1
 2. And the mandatory unified FPD SMU only if your current release version is below 6.1.1
(asr9k-px-<release>.CSCuy10934.pie)
*Filename subjected to change.
- (Optional) You can select a customized IOS-XR configuration file for CSM to load during Post-Migrate. If so, the existing IOS-XR configurations on device will be ignored.
- Alternatively, if no file is provided, CSM will migrate and load the existing configurations.
- You also have the option of overriding the hardware audit for FAN and PEM.

PreviousSchedule

Scheduling a Migration (Cont.)

- The migration action(s) can only be scheduled if CSM confirms that:
 - The pre-requisite for the selected action(s) is scheduled or completed successfully.
 - The latest configuration migration tool NoX from CCO is in `csm_data/migration/`, if not, CSM will download it before scheduling the actions.
- Click Schedule to schedule the action(s). CSM will redirect you to the install dashboard.

Walk-Through: Pre-Migrate

The CSM Pre-Migrate step is a collection of automated tasks designed to ensure your system is prepared for migration. Actions include (but are not limited to):

- Hardware and software checks
- Remove content from `harddiskb:/` and `harddisk:/dumper` and `harddisk:/showtech`
- Copy, conversion and storage of existing operational configuration (to be applied later in the Migrate and Post-Migrate step)
- Copy the ASR9K-64 tar file to `harddisk:/`
- Install the unified FPD SMU, check relevant FPD versions and perform FPD upgrades if necessary.

Session Logs: Pre-Migrate

The final converted configuration is in `csm_data/migration/Venus/xr.iox`

Session Logs: Pre-Migrate (Cont.)

More concerning the configuration conversion logs
(supported_config_in_xr_configuration and
unsupported_config_in_xr_configuration)

- At the end of both files, CSM points you to the original configuration file and the migrated configuration file. They are stored in `csm_data/migration/<hostname_of_device>/. The hostname may be slightly different from the one stored in CSM to ensure it's valid filename.`
- If you only scheduled a Pre-Migrate, you will have the option of checking how the conversion went. Otherwise, if there is no serious failure, you can check if any configurations failed to be converted/loaded after the Post-Migrate.
- The following files are available after Pre-Migrate completes:
 - `admin.cfg` and `xr.cfg` are the original configurations on device.
 - `admin.cal` is a part of the migrated `admin.cfg` that will be loaded in the Calvados/admin plane in ASR9K-64 during Post-Migrate. During Pre-Migrate, we copy this file to device as `harddiskb:/cXR_admin_plane_converted_eXR.cfg`.
 - If a custom ASR9K-64 IOS-XR configuration was selected, during Pre-Migrate, CSM will copy this custom configuration file to device as `harddiskb:/cXR_xr_plane_converted_eXR.cfg`, which is loaded during Migrate step.
 - If no custom ASR9K-64 IOS-XR configuration was selected, `xr.iox` and `admin.iox` are available as migrated `xr.cfg` and a part of the migrated `admin.cfg`. During Pre-Migrate, CSM merges these two files to create `cXR_xr_plane_converted_eXR.cfg` and then copy it to `harddiskb:/` on device, which is loaded during Migrate step.
 - `admin.csv` and `xr.csv`(if available) contain the line by line configuration migration detail.

The final converted configuration is in `csm_data/migration/Venus/xr.iox`

Walk-Through: Migrate

CSM manages the system migration which includes (but is not limited to) these major steps:

- Un-tars the ASR9K-64 tar file to put image and boot files in place.
- Sets the boot mode
- Backs up the admin and IOS-XR configurations in `harddiskb:/`
- Reloads the device in order to boot the ASR9K-64 image
- Waits for all RSP/RP and supported line cards to reach their final operational state
- Note that during the booting process of ASR9K-64, the system will load with best effort either the (a) migrated (converted) IOS-XR configuration or (b) a user-provided (custom) IOS-XR configuration (depending on the operators selection during scheduling)

Session Logs: Migrate

- A completed Migrate action will have the logs shown below (or more if added by the operator during the scheduling phase).
- By default, “show platform” is executed after the device boots up ASR9K-64 image. Click the red file comparison icon to compare the node status after Migrate completes with the node status during Pre-Migrate.

Session Log Files

Walk-Through: Post-Migrate

Once the Migrate action has completed, CSM performs the following during the Post-Migrate phase:

- Ensures all RSP/RP and supported line cards are in their final operational state
- Loads the migrated (converted) admin configurations
- Checks FPD versions and, if needed, upgrade FPD's and reload device

Session Logs: Post-Migrate

- A completed Post-Migrate will have at least the txt files below besides the logs. Post-Migrate executes “admin show running-config” and “show running-config” after loading corresponding configurations. It executes “show platform” in the end. Click the red icon to compare outputs with those from Pre-Migrate.
